

Abstract

A system for providing users of cellular, PCS, and wide-area wireless handsets with quick and short access to local and global information, based on the user's

5 preferences and location. The invention provides a quick link between wireless handset and dedicated information database. Information database is updated constantly by an array of Information Scanners, which run on Internet hosts. The Information Scanners scan Internet web portals, sites, and servers and filter required data into the dedicated info database. The final connection link is between the wireless handset and the

10 Information Scanner array.
